End Term · PitchPrep, Pre-Meeting Investor Brief: Components Map

Name + firm in, a sourced and verified brief out. All AI is Gemini Flash. Code, not the model, decides what is shown.

Actor	Trigger	Input	Context	Processing	AI	Output
Priya (Founder · human)	Investor meeting booked: she enters investor name + firm	Name + firm. Optional: meeting time, a post she pastes	Saved startup profile: stage, sector, raise, traction			Brief in about a minute: deals, thesis, watch-outs, 3 talking points
PitchPrep app (Next.js on Vercel)			Checks 6-hour cache and rate limits, loads profile, opens a job	Runs 5 searches in parallel under a 2-minute deadline; streams progress		
Live data layer (Google Search + page fetch)			Rules: robots.txt, no private addresses, no LinkedIn scraping	Resolves each citation, opens the article, reads its date and text		
AI model (Gemini Flash)					Searches the web, extracts claims with exact quotes, fact-checks, writes 3 talking points	
Verification gate (Code, not the LLM)				Quote must appear in source; deal dated in last 90 days; dedupe		Unverified claims dropped and listed as "left out and why"
Database (Supabase)			Briefs, claims, sources, cost and feedback; private per workspace	Logs status, time, tokens and cost for every brief		
Delivery (Web · PDF · share link)				Formats for skim reading; PDF export; share link		
Dashboard (Vercel)				Aggregates KPIs from Supabase		Live dashboard: time to brief, verification rate, cost per brief

HUMAN BOUNDARY

AI can research, cite, summarise and draft angles. It does not contact investors, state anything it cannot quote from a source, scrape LinkedIn, judge people or predict funding decisions. Which angle to use, and whether to take the meeting, stays with Priya.
